NONCOMMUNICABLE

DISEASES

Noncommunicable diseases impact people of every age and nationality

43 million

died of a **noncommunicable disease** (NCD) in 2021

18 million

people died from an NCD **before age 70** years

73%

of **all NCD deaths** are in **low and middle income countries** (LMICs)

What are noncommunicable diseases?

NCDs are long term conditions that are not infectious and often develop slowly over many years.

The most **common NCDs** are:

cardiovascular diseases (such as heart attack and stroke)

cancer

chronic lung diseases (such as asthma and chronic obstructive pulmonary disease)

diabetes

What increases the risk of NCDs?

NCDs are often linked to **everyday habits and environments**, including:

not being physically active

unhealthy diets (too much salt, sugar, and unhealthy fats)

smoking or exposure to tobacco smoke

harmful use of alcohol

air pollution

These factors can lead to:

high blood pressure

high blood sugar

high cholesterol

overweight or obesity

Why prevention matters

Many NCDs can be **prevented or delayed**. Small daily habits can make a big difference:

move more, sit less

eat a balanced, healthy diet

don't smoke

limit alcohol

get regular health checks

Early detection, support, and treatment help people live longer, healthier lives and reduce the need for more serious care later.

Most NCDs can be prevented or delayed.

A physiotherapist can help you make healthy choices and stay active, to live a longer, healthier, and more active life.

Benefits of exercise

Many NCDs can be **prevented or delayed**. Small daily habits can make a big difference:

boost energy and sleep better

control your weight

improve your aerobic fitness, so your heart and lungs work more efficiently

reduce blood pressure and cholesterol, lowering your risk of CVDs

help you feel less stressed and improve your mood

reduce your risk of developing type-2 diabetes

reduce your risk of developing some cancers

improve your balance, and reduce your risk of falls
